

10 **Refrigerating device for storing and presenting ice cream**Abstract

The invention relates to a refrigerating device 1 for storing  
15 and presenting ice cream, with a heat-insulating housing 2,  
where housing 2 displays a housing opening 3 and a storage  
device 4 with a receiving compartment 5 for ice cream, where  
housing 2 essentially surrounds receiving compartment 5 com-  
pletely and storage device 4 is mounted in housing 2 in rotat-  
20 ing fashion, and where a heat exchanger 6 for generating cold  
air is assigned to housing 2 and can be connected to a refrig-  
erating unit 7 located inside or outside housing 2, such that  
the ice cream in receiving compartment 5 can be refrigerated by  
the cold air generated. The invention is characterized in that  
25 storage device 4 is designed as an insert 9 that can be fitted  
and/or removed through housing opening 3. Insert 9 according to  
the invention is particularly characterized in that ice cream  
receiving compartment 5 is filled with unwrapped ice cream, at  
least in the area of adjacent delimiting walls 21. (Fig. 1)
